

Rolls-Royce

Overview

Exostar provides the following services and applications to Rolls-Royce and their trading partners:

- **eTools** represents a group of eBusiness applications used by Rolls-Royce and its supplier community. eTools includes a simple subscription and fee structure for all suppliers and provides access to the following applications through a single login ID and password:
 - **Exostar's Managed Access Gateway (MAG)** is used to manage Rolls-Royce suppliers that require access to the eTools set of applications, and other Exostar products.
 - **Federated Identity Service (FIS)** provides digital certificates to R-R users for use cases such as accessing the R-R Global Supplier Portal, authenticating to a website, digitally signing a document, or encrypting an email. These digital certificates are often associated with the term PKI (Public Key Infrastructure). eTools requires a basic digital certificate that is renewed annually. Medium level certificates are also available through FIS and applicable for some business requirements when working with Rolls-Royce.
- **Global Supplier Portal (GSP)** is managed by Rolls-Royce, but is accessed through Exostar's Identity and Access Management (IAM) Platform (formerly known as MAG). The Global Supplier Portal creates an interactive online location for Rolls-Royce and suppliers to conduct business transactions, post key information, answer questions, and resolve business issues.
- **Supply Chain Platform (SCP-RR)** is used by suppliers to view and respond to planning schedules. There is also visibility to goods receipts, invoice status and long term forecasts. SCP-RR allows suppliers to view and respond to orders and outline agreements. Rolls-Royce Marine suppliers can use SCP-RR to view and respond to orders, view goods receipts from Rolls-Royce and create advance shipment notifications.
- **SourcePass** allows Rolls-Royce to collaborate with suppliers on its procurement (sourcing) needs. Suppliers can respond to RFI/RFPs/RFQs and participate in e-auctions within SourcePass. The response/bid information can be analyzed and suppliers can be awarded business within SourcePass.
- **ForumPass** enables Rolls-Royce and its partner organizations to work together in a shared internet-based workspace. ForumPass is built on the Microsoft SharePoint Platform and is most commonly used for project and workflow collaboration.
- **Secure File Transfer** is a secure, cloud-hosted application for sending and receiving digital packages securely. The application is powered by a patented third party transmission protocol technology that maximizes the throughput over a standard Internet connection.

The following applications are available to Rolls-Royce employees:

- **Enterprise Access Gateway (EAG)** allows R-R employees to use their R-R network login credentials to access Exostar and other third party applications such as the Boeing Supplier Portal, instead of being issued login credentials from Exostar.
- **LDAP Proxy** is a directory look-up service provided by Exostar for R-R users who have been issued digital certificates by Exostar. Using a simplified and automatic look-up function, R-R users that have registered their public keys can send secure and encrypted email to other R-R users and even users within other Exostar customer organizations.
